Source: Urban-Brookings Tax Policy Center Microsimulation Model (version 0412-8).
(1) Calendar year. Effective marginal tax rates are weighted by the appropriate income source. Baseline is current policy, proposal would raise the top regular individual income tax rate by one percentage point to 36 percent for tax units whose taxable income is above $\$ 1$ million less the standard deduction and two personal exemptions for married couples, $\$ 800,000(\$ 900,000)$ less the standard deduction and one exemption for singles (heads of household). Those values are expressed in 2009 dollars and result in actual thresholds of $\$ 851,550$ for single taxpayers, $\$ 1,064,450$ for married taxpayers filing jointly, $\$ 958,000$ for heads of household, and $\$ 532,200$ for married taxpayers filing separately. For a description of TPC's current law and current policy baselines, see:
http://taxpolicycenter.org/numbers/displayatab.cfm?Docid=3131
(2) Includes both filing and non-filing units but excludes those that are dependents of other tax units. Tax units with negative cash income are excluded from the lowest income class but are included in the totals. For a description of cash income, see
http://www.taxpolicycenter.org/TaxModel/income.cfm
(3) The income percentile classes used in this table are based on the income distribution for the entire population and contain an equal number of people, not tax units. The breaks are (in 2012 dollars): $20 \%$ \$20,113; $40 \%$ \$39,790; 60\% \$64,484; 80\% \$108,266; 90\% \$143,373; 95\% \$204,296; 99\% \$506,210; 99.9\% \$2,655,675.
