(1) Calendar year. A tax unit's effective marginal individual income tax rate is calculated by adding $\$ 1,000$ to the income source and then dividing the resulting tax change by $\$ 1,000$. The averages are calculated by weighting by the initial value by the appropriate income source.
(2) Includes both tiling and non-tiling units but excludes those that are dependents ot other tax units. Tax units with negative adjusted gross income are excluded trom their respective income class but are included in the totals. For a description of expanded cash income, see http://www.taxpolicycenter.org/TaxModel/income.cfm. The income percentile classes used in this table are based on the income distribution for the entire population and contain an equal number of people, not tax units. The breaks are (in 2013 dollars): 20\% $\$ 24,844 ; 40 \% \$ 48,286 ; 60 \%$ \$82,182; 80\% \$137,646; 90\% \$188,937; 95\% \$271,750; 99\% \$638,232; 99.9\% \$3,379,269.
(3) We calculate each tax unit's effective marginal individual income tax rate by adding $\$ 1,000$ to the income source and dividing the resulting tax change by that $\$ 1,000$. We then calculate the averages by weighting by the initial value of the appropriate income source.
(4) We calculate each tax unit's effective marginal individual plus payroll tax rate by adding $\$ 1,000$ to wages and salaries. We then divide the resulting change in individual income tax plus the resulting change in the employer and employee portions of payroll taxes for Social Security and Medicare by that $\$ 1,000$. We then calculate the averages by weighting by the initial value of wages and salaries. For married couples filing jointly, we assign a portion of the $\$ 1,000$ increase to each spouse based on their initial shares of the household's total wages and salaries.
