Source: Urban-Brookings Tax Policy Center Microsimulation Model (version 0305-3A).

(1) Calendar year. Baseline is current law with the extension of the 2005 AMT exemption levels (\$58,000 for married couples and \$40,250 for singles and heads of household), indexed for inflation after 2005; allowance of personal non-refundable credits regardless of tentative AMT; and extending the non-refundable credit for elective deferrals and IRA contributions (the "saver's credit"). Proposal includes limiting the individual income tax cuts due to the following provisions in EGTRRA, JGTRRA, and WFTRA to \$50,000: marginal tax rates; the 10-percent bracket; the child tax credit; the child and dependent care credit; the standard deduction, 15-percent bracket, and EITC for married couples; tax rates on long-term capital gains and dividends; pension and IRA provisions; expansion of student loan interest deduction (excludes other education provisions). The effect of these provisions is measured against a pre-EGTRRA baseline with the extension of the 2000 AMT exemption levels (\$45,000 for married couples and \$33,750 for singles and heads of household), indexed for inflation after 2000; and allowance of personal non-refundable credits regardless of tentative AMT.

(2) Tax units with negative cash income are excluded from the lowest income class but are included in the totals. For a description of cash income, see <http://www.taxpolicycenter.org/TaxModel/income.cfm>

(3) Includes both filing and non-filing units. Tax units that are dependents of other taxpayers are excluded from the analysis.

(4) After-tax income is cash income less: individual income tax net of refundable credits; corporate income tax; payroll taxes (Social Security and Medicare); and estate tax.

(5) Average federal tax (includes individual and corporate income tax, payroll taxes for Social Security and Medicare, and the estate tax) as a percentage of average cash income.
